C. I- FUNCTION: DNA-DEPENDENT RNA POLYMERASE CATALYZES THE TRANSCRIPTION

C. OF DNA INTO RNA USING THE FOUR RIBONUCLEOSIDE TRIPHOSPHATES AS

C. SUBSTRATES (BY SIMILARITY).

C. I- ATALYTIC ACTIVITY: N NUCLEOSIDE TRIPHOSPHATE = N PYROPHOSPHATE +

C. I- RNA(N) (BY SIMILARITY).

C. I- SIMILARITY: BELONGS TO THE RNA POLYMERASE BETA CHAIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C factor 1 (CCF-1). The protein has antiparasitic, antibacterial and cartiful flammatory activity. Recombinant coelomic cytolytic factor 1 (CCF-1) is trypanolytic factor 1 (CCF-1) is trypanolytic rot the African trypanosome Trypanosoma brucei in a dose-dependent manner. The trypanolytic activity of rCCF-1 can be inhibited by anti-CCF-1 and anti-tumour necrosis factor (TNF)/TIP monoclonal antibodies. Furthermore, N,N'-diacetlychitobiose inhibits potently trypanolytic activity of rCCF-1. These data corroborate the findings that CCF-1 shares a trypanolytic, lectin-like domain with TNF-alpha. CCF-1 is useful to treat trypanosomal or bacterial infections or cancer. The proteins and peptides are also useful in tumour therapy, inflammation and other areas of immunology. The annelid peptide is lipopolysaccharide and beta-1,3-glucan. The factor resembles the vertebrate tumour necrosis factor-alpha (TNF-alpha), and may be used as

Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAV29457). Claimed DNA constructs that encode the novel BG (see also AAW29455), a mannose binding domain (see AAW29458) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29456), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       В
                                                                    C This sequence comprises the polypeptide precursor of a novel C Oerskovia xanthineolytica enzyme that exhibits beta-1,3-glucanase C (BG) activity and which includes a mannose binding domain (MBD). C Its amino acid sequence was deduced from an isolated genomic DNA c sequence (see AAT89156). Claimed DNA constructs that encode the novel BG lacking a MBD (see AAW29455 and AAW29457), a MDB (see CAW29458), or the full-length enzyme can be used to produce recombinate BG polypeptides, with or without a mannose binding domain, in fungal consolidation or modification of beta-glucan containing material, corporated by the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the
                                    production of e.g. pigments, colourants, flavourants, yeast extracts, pharmaceuticals, food or feed compositions, and t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAW29458) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29456), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the production of e.g. pigments, colourants, flavourants, yeast extracts, pharmaceuticals, food or feed compositions, and to prepare protoplasts for use in fusion, transformation and cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This polypeptide comprises a novel Oerskovia xanthineolytica (OX) enzyme that exhibits beta-1,3-glucanase (BG) activity. Its amino acid sequence was deduced from an isolated genomic DNA sequence (see ANT89155). Claimed DNA constructs that encode the novel BG also ANW29456 for corrected sequence), a mannose binding domain (AAW29458) or a full-length enzyme, i.e. BG with mannose binding
           Bombyx mori mature LPS-binding protein

Partial amino acid sequence was used to generate PCR primers (AAT10280-1). These amplified a fragment of the gene used as a probe to obtain the full length gene (AAT10879) by screening a cDNA library derived from B.mori previously injected with heat-Killed E.cloacae. The protein or fragments of it, can be used to treat diseases associated with LPS complexes e.g. septic shock, to remove LPS from products used for injection and to protect transgenic plants

                                                                                        This is the amino acid sequence of the full length lipopolysaccharide (LPS) binding protein from Bombyx mori. The protein was isolated from the haemolymph of fifth stage B.mori larvae after injection with Enterobacter cloacae strain 57-9. Partial amino acid sequence was used to generate PCR primers (AAT10280-1). These amplified a fragment of the gene used as a probe to obtain the full length gene by screening a cDNA library derived from B.mori previously injected with heat-killed E.cloacae. The protein or fragments of it, can be used to treat diseases associated with LPS complexes e.g. septic shock, to remove LPS from products used for injection and to protect transgenic plants e.g. vines, tobacco, tomato or potato, against fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lipopolysaccharide binding protein; Bombyx mori; haemolymph; primer; Enterobacter cloacae; PCR; polymerase chain reaction; amplification; probe; LPS-complex; septic shock; injection; transgenic plant; vine; tobacco; tomato; potato; fungal infection; fungus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT
                      The new enzyme is derived from alkaoplhilic Bacillus Sp. The enzyme acts on beta-1,3-glucans to form glucose and laminaribiose It is stable over a wide pH range with opt. activity at weakly actidic pH and has good heat resistance.

Recombinant beta-1,3-glücanase can be produced on a large scale using transformed host cells, esp. Bacillus subtilis DN1885 or ToC46. Protease-free beta-1,3-glücanase can be obtd. that is useful for lysing fungal cell walls, allowing recovery of intracellular proteins. The enzyme is also useful for the prepn. of protoplasts and for the prodn. of pigments, colorants, flavours, yeast extract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LLG109

The ENDO-A protein can be used in conjugation with alpha-N-acetylgalactosaminidase to remove externally and internally linked A antigen on group Al erythrocytes. The resulting erythrocytes may be transfused into individuals who would be otherwise unable to safely tolerate a transfusion of type Al blood. The ENDO-A protein can also be used to degrade keratan sulphate (e.g. in the food industry), or in blood typing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAQ81334 encodes AAR67915 a (1-3)-beta-D-glucan sensitive facto has a high affinity for the (1-3)-beta-D-glucan found in fungal cell walls. The protein is therefore useful for clinically diagnosing mycosis, and as an antifungal agent for the removal

```

```
This sequence represents a novel Streptomyces sp. SGTase protein has beta-1,3-glucanase activity. A large amount of SGTase can be prepared using the recombinant DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 7-9;

            The present sequence represents the filamentous fungus Phaffia rhodozyma (CBS No. 6938) endo-1,3(4) beta glucanase sequence. The enzyme may be used for modification or degradation of material which contains beta-glucan. Therefore the enzyme is claimed to be useful in, e.g. brewing, wine-making, preparation of protoplasts from yeasts, or preparation of pigments, colourants or flavourants. The enzyme is also claimed to be useful in the preparation of
